1) Have any data been collected for this study already?

It's complicated. We have already collected some data but explain in Question 8 why readers may consider this a valid pre-registration nevertheless.

2) What's the main question being asked or hypothesis being tested in this study?

The primary purpose of this study is to examine the link between cognitive reflection and the ability to discern true versus false news statements in the context of Ukraine. Prior work using Americans has found that more reflective people show better truth discernment. Here we are testing how the pattern compares in among Ukrainians.

3) Describe the key dependent variable(s) specifying how they will be measured.

The key dependent variable is the perceived accuracy of a series of 16 statements (measured using a 6-point Likert scale), 12 of which are false and 4 of which are true.

4) How many and which conditions will participants be assigned to?

One condition

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

To examine our main question of interest, we will conduct a series of regression models with perceived accuracy as the dependent variable (one observation per rating, 16 observations per subject). There were be four main models, which will all have the following independent variables: statement veracity (0=false, 1=true),

subject cognitive style (z-scored), subject orientation towards Europe versus Russia (z-scored), and all interactions. The models will vary in their definition of cognitive style and ideological concordance. Cognitive style will be measured using (i) number of correct answers on a 7-item (3 numerical, 4 non-numerical) Cognitive Reflection Test and (ii) averaged responses to a set of 24 questions measuring Active Open-minded Thinking (a combination of a 7 item scale and a 17 item scale). Subject orientation will be measured in the following two ways: (i) a Russian-oriented variable that aggregates 3 questions asking which language they use in various situations, and a question asking which ethnic groups they identify with (Speaking Russian implies greater pro-Russian orientation, as does identifying as an ethnic Russian; speaking Ukrainian and identifying as ethnic Ukrainian are indicators of a pro-Ukraine orientation). (ii) a classification based on the political party they are closest to: Anti-Europe (Opposition Bloc, Renaissance, Nash Krai, Opposition Platform For Life, Osnova, Nashi), Pro-Europe (Movement of New Forces – Mikheil Saakashvili, BPP-Solidarity, Batkivshchyna, UKROP, Civic Position, Samopomich, People's Front, Radical Party of Oleh Lyashko, People's Force, Servant of the People, or party led by Sviatoslav Vakarchuk), Far Right (Svoboda, National Korpus, Democratic Alliance, Right Sector), or Other. We will score Pro-Europe as -1, Anti-Europe a 1, and Far Right or Other as 0.

For each of the four models, we will ideally use multilevel mixed effects models with random intercepts and random slopes for both subject and statement. If the full model does not converge, we will try random intercepts only. If this model still does not converge, we will use linear regression with robust standard errors clustered on subject and statement.

We will also repeat each model including controls for age, gender, education and income.

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

None

7) How many observations will be collected or what will determine sample size?

No need to justify decision, but be precise about exactly how the number will be determined.

2040 respondents were recruited.

8) Anything else you would like to pre-register?

(e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

Secondary analyses:

We will repeat the main analyses separately using the numerical versus non-numerical CRT questions, and the 7 item versus 24 item AOT scales.

We will look at zero-order correlations between CRT, AOT, and each of the 16 different forms of statement [economics, military, nazi/historical, political realignment]x[disparage US/EU/NATO, build up Russia, undermine Ukraine, no strategy/real news]. We will also do this separately for Pro-Europe subjects, Pro-Russia subjects, and Far Right subjects.

We will look at zero-order correlations between CRT, AOT, the measure of support for Ukraine vs Russia described above, membership in a Pro-Europe vs Pro-Russia vs Far Right party vs Other, having voted, income, and education.

Other:

We also collected data using a visual form of the CRT to pilot that measure. We do not anticipate using those

results in the paper that results from this pre-registration, but may use the data at some point in the future.

Regarding "it's complicated":

The data have been collected by another set of researchers, but those of us composing this pre-registration have not yet analyzed it at all.

This pre-registration currently has an anonymized pdf. For publication you should make the pre-registration public. This will add the authors' name to the .pdf, drop the "CONFIDENTIAL" warning from the top of the page, and ensure a copy of the pre-registration is sent to the Web Archive.

If you click you will see more information and can still change your mind.

MAKE PUBLIC
